

attachment to the adjacent corners of a pair of members to be connected, the corresponding angular parts being formed with inclined slots, and a pair of pivotally connected
5 links each of which is pivoted to one of the angular parts in line with the slot thereof and has a pivoted sliding connection with the slot of the other member the links extending below the confines of the members
10 when they are in aligning position.

2. In a concealed hinge, a pair of sectionally angular plates for attachment to the underside of members to be connected, and having an upright slotted portion connected
15 to the base portion by an offset rounded groove, and links having a pivotal connection

with each other and a pivotal and sliding connection with both of the plates.

3. In a hinge of the class described, a pair of sectionally angular plates each having a
20 base and a slotted portion at right angles thereto and adapted to abut on a predetermined line at the ends of the plates, there being a projection from the base of one of the plates and a corresponding recess in the
25 base of the other plate, the projection of which overlaps the normal abutting line of the plates, and means forming a pivotal and sliding connection between the slotted portions of the plates.
